Partial acetylation of fisetol and of ω -hydroxylphloroacetophenone¹ I. G. Zenklen, L. Meller, and L. Falcs

Acta Chim. Acad. Sz. Hung., 8, 131-8 (1955) (in German)
(English summary).—Partial acetylation of fisetol (ω -hydroxyresacetophenone) (I) gives fisetol 4, α -diacetate (II), also prepd. by deacetylation of fisetol triacetate (III). Similarly, ultraviolet spectra indicate that partial acetylation of ω -hydroxylphloroacetophenone (IV) gives 4-acetyl- ω -acetoxyphloroacetophenone (V). I (2 g.) in 10 ml. H₂O contg. 0.95 g. NaOH was added with cooling to 2.4 ml. Ac₂O and 10 ml. CHCl₃; after 10 min., the layers sepd.; the aq. layer washed with CHCl₃, and the latter removed *in vacuo* to give II, oil, which crystd. after a few days, m. 99-100° (aq. MeOH). II was also prepd. by deacetylation of III by adding 57.0 mg. NH₃ in abs. ale. to 1 g. III, m. 94°, in 60 ml. abs. ale., shaking the mixt. 30 min., and removing the ale. *in vacuo* to give an oil which dissolved in C₆H₆, washed with H₂O, and the C₆H₆ removed gave II. Methylation of II by CH₃N₃ failed. II was proved not to be fisetol 2,4-diacetate (VI) by comparison of the ultraviolet spectra. Diacetyl- β -resoreylie acid (10 g.), in 130-8°, warmed with excess SOCl₂ 2 hrs. at 40-50°, the excess SOCl₂ removed, the residue dissolved in 10 mL CHCl₃, and treated with 15 g. C₆H₆ in abs. ether while cooling with ice and salt, the mixt. allowed to stand overnight, and the ether removed gave the diazo ketone, to which was added 10 ml. H₂O and 15 ml. 5% H₂SO₄, heated 30 min. at 40-50°, and VI filtered off, m. 130-2° (aq. ale.). Hydrocyanonitrile (8.5 g.) and 18.7 g. dry phloroglucinol in 320 ml. abs. ether treated with 0.5 g. ZnCl₂ and boiled at 6° with dry HCl 2-3 hrs. gave an oil which crystallized, m. 104°, red is the ketamine hydrochloride. This

5

11

Zempien, J.G.; Mester, L.; Pallas, L.

dissolved in 10 parts H₂O and heated 30 min. at 80° gave IV,
m. 220° (H₂O). - IV (1 g.) in 6 ml. H₂O and 0.65 g. NaOH
added with cooling to 1 ml. Ac₂O in 5 ml. CHCl₃, and the
mixt. treated as above for making II gave V, needles, m.
167-9°. Powd. ω -hydroxyphloracetophenone tetraacetate,
m. 109-10°, (1 g.) in 60 ml. abs. alc. was added to 0.0493 g.
NH₃ in alc., the mixt. shaken 1.5 hrs., and treated with 2
ml. H₂O to give an oil, recrystd. from aq. MeOH. V (0.81
g.) in 4 ml. abs. ether was treated at 0° with Cl₂N₂ in
ether to max. decolorization, after which prisms were ob-
tained of ω -acetoxy-2-methylphloracetophenone 4-acetate,
m. 121° (aq. acetone). Enno Wolthuis

Carbohydrate analogues of β -hydroxybenzaldehyde (thiosemicarbazone) Ia, IIa, O. Zemplén, L. Mester and G. Szántay (Acta Chim. Hung., 1933, 6, 139-147). The prep. (by standard methods) and characteristics of the glucosides of the thiosemicarbazones of β -hydroxybenzaldehyde, vanillin and eovanillin are described. Their anti-tubercular effect is $< 1/2 \times 10^4$ in comparison with $1/16 \times 10^4$ for β -methoxybenzaldehyde thiosemicarbazone (Tb. II). Introduction of a carbohydrate group, whilst increasing the solubility ~25 times, has an unfavourable anti-tubercular effect.

Recent progress in the diazotype process. III. Photo-diazotype process on wool and silk. László Mester (Techn. Univ., Budapest). *Science of Inds. phot.* 20, 624-628 (1955); cf. *C.A.* 49, 11473d.—Wool and silk are colored bright-yellow by treatment with HNO_2 . The reaction has been interpreted by various authors as a diazotization or as the introduction of a nitroso group. Expts. were made to decide between these views. The absorption spectrum of the HNO_2 -treated wool (I) or silk (II) has the same absorption max. and form as that of 1-diazo-2-naphthol-4-sulfonic acid (III). I and II lose their bright-yellow color on exposure to sun-light or Hg-lamp light. Exposed samples produced distinctly different colors from the unexposed samples when treated with 2-naphthol in alc. soln., a salt of II acid in neutral medium, or solns. of phloroglucinol (IV) or resorcinol (V) in the presence of NaSO_4 and developed by NH_3 . The exposed samples gave a deep-violet color when coupled with a diazo compd. in the presence of NH_3 ; the unexposed remained almost unchanged. Photolysis of many diazo compds. is known to give phenols capable of subsequent coupling with diazo compds. The coupling activity of I and II towards IV, V, and Na 2-naphthol-3,8-disulfonate was detd. and compared with the coupling activity of di-t-tyrosine (VI), III, β -diazodiphenylamine, and β -di-acidimethylaniline. The coupling activity of I and II was similar to that of III and VI. The dye formed by coupling I and II with IV was extd. from the samples by treatment with 10% NaOH and compared with the dye formed by coupling VI and IV. The ultraviolet absorption spectra were identical. Conclusion: the light-sensitive agent in I and II is formed by diazotization of the tyrosine which is a constituent of wool and silk. Introduction of a nitroso group occurs to only a slight extent and gives a product which is practically insensitive to light. Continuous tone images can be formed by exposure of I or II through a negative.

CH ✓ The formazan reaction in proving the structure of *beta*-dextrose-oxidized polysaccharides. L. Mester (Tech. Univ., Budapest). J. Am. Chem. Soc. 77, 4482-3 (1955); cf. preceding abstract. When coupled with diazotized PhNHNH₂ in ice-cold pyridine, the phenylhydrazones of the products from several polysaccharides (cellulose, starch, inulin, xylan, and dextrin) which had been oxidized with HIO₄ yielded diphenylformazans. This reaction gives unambiguous proof of the presence of structure I in these compds. A structure is proposed for the formazans obtained.

Title : Synthesis of Glycosgenquinano.

Orig Pub : Magyar tud. akad. Kém. tud. oszt. közl., 1956, 7, N° 3-5

Abstract : Glycosgenquinano (7-methoxy-5,4'-bixiflavone-5-glycoside) (I) discovered earlier (Ohta, Nishikawa, J. Pharmaco. Soc. Japan, 1947, 67, 40) in *Prunus serrulata* was synthetized. The authors departed from flavanone-5-glycoside (sakuranin) (II), which they had synthesized earlier (see Ber., 1942, 75, 1432). The pentaacetate of II (III), melting point 198° (from alcohol), was produced by the acetylation of II (in pyridine (CH_3CO)₂O). 3-bromosakuraninpentaacetate (IV), melting point 172 to 174° (from alcohol), was produced by the

bromination of III. I, melting point 272 to 273° (from alcohol) was produced by the saponification of IV with a simultaneous splitting off of HBr. Having produced I, the authors considered that they have completed the synthesis of flavonoid glycosides, in which sugar is in the ortho position with reference to the carbonyl group, and the OH group in the para position is methylated. The synthesis confirms the earlier suggested structure of I (see the above reference.)

Identification of aldoses in the form of formazan by their phenylhydrazones. L. Mester and A. Major (Tech Univ., Budapest). *J. Am. Chem. Soc.* 78, 1403-4 (1956).

Aldoses were identified by the use of the formazan reaction. Aldoses were identified by the use of the formazan reaction. Phenylhydrazine (0.3 g.) in 25 cc. concd. HCl and 25 cc. H₂O diazotized at 0-6° with 7.0 g. NaNO₂ in 16 cc. H₂O and dried with H₂O to 93 cc. gave the reagent. The appropriate aldose (0.45 g.) and 0.45 g. PhNHNH₂ in 2.5 cc. H₂O (or 2.5 cc. 50% EtOH, or 2.5 cc. pyridine) allowed to stand at 20 ± 2°, 2.5 cc. pyridine added after the desired period of time, 10 cc. 10% alc. solns., and 2.5 cc. abs. EtOH added to the soln. and the mixt. refrigerated, treated dropwise with 10 cc. 10% NaOH, and 24 g. PhNH₂ allowed to stand at 20 ± 2°. After 3, 24, and 48 hrs. the precipitate was collected, washed with water, refrigerated overnight, and the solid washed with EtOH, a portion filtered and dried in air at room temp. yielded the corresponding formazan (I). In this manner were prepd. the I from the following aldoses (% yields after 3, 24, and 48 hrs. in H₂O, 50% EtOH, and pyridine given): D-galactose, 20.5, 64.5, 73.0; D-glucose, 0.0, 18.5, 58.5, 67.0, 28.2, 60.5, 71.0; D-glucose, 0.0, 64.5, 73.0, 14.3, 18.0, 3.4, 38.2, 04.0; D-xylose, 30.4, 8.4, 0.0, 7.9, 14.3, 18.0, 3.4, 38.2, 04.0; L-arabinose, 28.5, 81.4, 23.9, 10.4, 48.7, 29.8, 50.5, 54.5; L-arabinose, 38.5, 41.3, 34.1, 46.0, 36.4, 43.5, 48.0, 41.3, 41.3; L-threonose, 17.5, 42.9, 13.7, 25.5, 22.0, 12.7, 32.4, 45.0; ribose, 21.0. In the case of mannose (in all 3 solvents) the pptd. phenylhydrazone was washed with EtOH, H₂O, and Et₂O, dissolved in 98 cc. pyridine, and the soln. dried with 7 cc. EtOH and the reagent soln. from 0.24 g. PhNH₂ added to give 0.63, 0.43, and 0.48 g. I, resp. No I could be obtained from L-sorbose or D-fructose in any of the media.

Monosaccharides A.
The crystal form and m.p. were for the diphenylboronate
esters. From the 2,3-O-isopropylidene-D-glucopyranose, red needles, 177-8°;
from the 2,3-O-isopropylidene-D-galactopyranose, micro-
crystalline, m.p. 175-6°; from the 2,3-O-isopropylidene-D-mannopyranose, fine brown-red
needles, m.p. 175-6°; from the 2,3-O-isopropylidene-D-allopyranose, fine brown-red
needles, m.p. 175-6°. From the 2,3-O-isopropylidene-D-xylose,
red needles, m.p. 175-6°. All esters were prepared from hot EtOH/HCl; xylose
was refluxed with HCl until the solution became clear, then hot EtOH with
isopropylidene dichloride until the solution became clear again. The yield of the I in H₂O at 20° was 5-10 mg / 100
cc. E. W. Hoffmann

24 hours, dissolved in 0.3 ml absolute alcohol, and on cooling were obtained the dark red crystals of D-glucoszone-formazan [$(N,N'$ -diphenylformazyl)-D-arabotetrahydroxy-butyl ketone] (III) MP 163°, yield 0.22 g. 0.15 g III were dissolved in mixture of 6 ml glacial CH_3COOH and 1.5 ml alcohol, with moderate heating, and 0.05 g phenylhydrazine were added. After standing for 4.5 hours, separation took place of violet crystals of I (0.03 g). The mother-liquor was poured in 40 ml water and the precipitate of I that separated was filtered off (yield 0.04 g). On combining these two products crystals were obtained from a solution consisting of 6 parts pyridine and 15 parts ethanol. The identical nature of compounds prepared by these two methods proves not only the structure of I, but also the fact that in the molecule of II the phenylhydrazine residue is added to C(1), since

42. The partial acylation of fuctol and α -hydroxy-phloracetophenone. (In German) G. Zempp
[redacted] L. Pallas. Acta Chimica Academiae Scientiarum Hungaricae. Vol. 13, 1957, No. 1-2.
pp. 99-102

Starting with α -acetyl fuctol the authors intended to prepare partially methylated derivatives of fuctol and α -hydroxyphloracetophenone which contain a free hydroxyl group in the α -position. By treating α -acetyl fuctol or α -methoxy phloracetophenone with methyl chloride in pyridine sodium 2,4-dimethyl- α -acetyl fuctol and 2,4,6-trimethyl- α -methoxy phloracetophenone have been prepared. Hydrolysis of the products gave 2,4-dimethyl fuctol and 2,4,6-trimethyl- α -hydroxyphloracetophenone which actually contain the hydroxyl group in the required α position.

Heavy metal complexes of formazans of polysaccharides.
L. Meszar (Hungarian Acad. Sci., Budapest). J. Polymer

Sci. 30, 239-45 (1958) (in German).—The *N,N'*-diphenyl-formazans of periodate-oxidized cellulose, dextran, and inulin (C.A. 50, 8835ag) were boiled 10-60 min. in an EtOH soln. of uranyl acetate to give metal complexes contg. 1.2, 1.3, and 1.6 mole ratio of formazan/U, resp. The corresponding *N*-phenyl-*N'*-(2-carboxyphenyl)formazan complexes had mole ratios of 0.8, 0.4, and 0.9, resp. Model complexes, made by treating uranyl acetate with *D-galacto-*
N,N'-diphenylformazan, *D-galacto-**N,N'*-diphenylformazan penta-O-acetate, *D-galacto-**N*-phenyl-*N'*-(2-carboxyphenyl)formazan, and the penta-O-acetate of the latter had formazan/U ratios of 1:1, 2:1, 1:1, and 1:1. Hence, free OH or CO₂H groups in the formazan can participate in the formation of these complexes. These uranyl complexes show strong shading effects under the electron microscope. This is believed to offer a new technique for research on polysaccharides. Formazans of viscose fibers partially oxidized with periodate or ozone and complexed with Cu, U, or Co have lively brown-violet or orange colors and may be regarded as chemically dyed fibers. W. E. Gloger

Anat. Patol., Spital 'Gh. Marinescu'. Bucureşti - MORFOL. NORM. SI. PAT.
1959, 4/2 (17' -181) Illus. 3

Former studies of the author demonstrated the existence of a reticular pattern in a ganglion of the sympathetic trunk and of an intracapsular perikaryonal network of reticulin fibres, considered to be the product of satellite cells. The present paper describes the features of the perineuronal reticulin membrane in its morphological evolution during chronic non-specific autonomic ganglionitis. The appearance of a dense, impermeable and inextensible membrane impairs neuronal metabolism and results in atrophy followed by necrosis of the neurons with or without consequent calcification of the cells.

*The mechanism of the action of intrathecal streptomycin in tuberculous meningitis
(Russian text) SOVETSK. MED. 1953, 8(30-31)

Experience gained on 200 patients shows that this treatment causes in 87.5% of cases sleep and in 10% drowsiness. This reaction is more marked on cisternal than on intrathecal administration and absent on i.m. injection. It begins 2-20 min. after the injection and lasts generally from 2-4 hr. In 16 cases it was proved that the sleep was caused by streptomycin and not by the puncture, evacuation of CSF, normal saline or distilled water. It can become a conditioned reflex as demonstrated in one patient who used to fall asleep after streptomycin but did the same after an injection of distilled water. This sleep induced by the intrathecal treatment is considered beneficial.

Inhalation of vapours developing from the welding agent containing fluor upon the health of welders
The working condition during welding with basic electrodes is discussed. The concentrations of fluor in the air were measured (0.1-28 microgram per litre). The fluorides are considered to be the main harmful factors, when their presence in the air during the welding with electrodes of larger diameters exceeds the permissible limit even behind the shield and whilst working in closed spaces. In the foreground of the clinical picture stands irritation of the mucous membranes of the upper respiratory passages with subjective manifestations.

"Glycols and their Derivatives."

Prague, Pracovní Lekárství, Vol 15, No 7, 1971, pp. 451-51

Abstract: The authors offer first the definition of glycols. Then they list their general chemical behavior and properties and mention their main industrial uses. The following general physiologic properties and applications are discussed: Ethyleneglycol, propyl methylglycol, tri-glycol, hexyleneglycoldiethyleneglycol, di-ethyleneglycol, tri-ethyleneglycol, poly-ethyleneglycol, butoxypropylglycol, neoglycol, polypropyleneglycol, glycol monoacetates, m ethylglycol acetate, ethylglycol acetate, ethyleneglycol monoacetate, propyl-neo-glycol acetate, methyl-1,3-butyleneglycolacetate, ethyl-1,3-butyleneglycol acetate, glycol di-acetate, diethylglycol di-acetate, propyleneglycoldiacetate, ethylacetylglycolacetate, ethyleneglycol-monomethylether, mono-, di-, and tri-propyl neoglycolmethyl-ether, dipropylglycolmethyl-ether, ethyleneglycolmonoethyl-ether, di-ethylene-glycolmonoethyl-ether, ethyleneglycolmonobutyl-ether, di-ethylene-

TITLE: Investigation of K_2^0 -meson decays 1944 5

SOURCE: Yadernaya fizika, v. 2, no. 3, 1965, 471-481

TOPIC TAGS: K meson, meson interaction, lepton, radioactive decay, selection rule, pion

ABSTRACT: The authors presented at the 12th International Conference on High Energy Physics, Dubna, 1964, preliminary results of analyses of 683 K_2^0 -mesons detected in a Wilson chamber. In the present article, the authors present a more complete analysis using a larger statistical material (1082 K_2^0 -mesons). The following probabilities were obtained for leptonic decays of the K_2^0 -meson and for the decay $K_2^0 \rightarrow \pi^+ + \pi^- + \pi^0$ (with respect to all K_2^0 -decays into charged particles): $\Gamma_2^0 (+ - 0) / \Gamma_2^0$

Card 1/2

L 13551-66

ACC NR: AP6001154

(charged) = 0.194 ± 0.024 and $\Gamma_2(K_{e3}) + \Gamma_2(K_{\mu3}) / \Gamma_2(\text{charged}) = 0.806 \pm 0.090$. The data on leptonic decays exclude the S-type interaction and are in good agreement with the V-type interaction and the predictions based on the $|\Delta T| = 1/2$ selection rule. The energy spectrum of π^0 -mesons in the $K^0 \rightarrow \pi^- + \pi^+ + \gamma$ decay differs significantly from the phase curve $\phi(T_0)$. The value $\kappa = -8.2 \pm 1.3$ was obtained for the coefficient κ in the linear approximation $dW(T_0) / d\phi(T_0) = 1 + \kappa T_0 / M_{KO}$, which is also in good agreement with the $|\Delta T| = 1/2$ selection rule. Assuming the existence of a δ -dipion resonance, the following values are obtained for its mass and width: $M_\delta = (350 \pm 10)$ MeV and $\Gamma_\delta = (75 \pm 15)$ MeV. In conclusion, the authors consider it their pleasant duty to thank B. M. Pontecorvo [Pontekorvo] for fruitful discussions and constant interest in the work; V. I. Veksler, I. V. Chuvilo and the entire staff of the proton-synchrotron, who assured the execution of the experiment; and E. L. Andronikashvili, V. P. Dzhelepov, and Z. Sh. Mandzhavidze for assistance in the work. Authors also extend their thanks to the group of laboratory technicians and mechanics consisting of N. I. Grafov, L. Goncharov, P. Zhabin, L. Lyubimov, D. Sverdin, V. Smirnov, V. Stepanov, L. Filatov, and L. Filippov, and the students O. Dumbravita and V. Novikov for performing the calculations. Orig. art. has: 10 figures, 4 tables, and 1 formula.

"Toxological Characteristics of Small Repeated Doses of the Insecticide Heptachlorine."

Prague, Pracovni Lekarstvi, Vol 18, No 4, May 66, pp 153 - 157

Abstract /Authors' English summary modified/
of heptachlorine was administered to rats. The main effect of the substance is a reduction of fertility; experimental rats had first litters 35% smaller than controls. The survival of the young rats was a third lower than in controls. No pronounced deviations of parenchymatous organs were observed. The reproduction mechanism is more sensitive to heptachlorine than the liver and the kidneys. 7 Tables, 10 Western, 2 Czech, 1 Russian reference.

"Cataractogenous Effect of Chronic Administration of Chloroheptane
in White Rats."

Prague, Pracovni Letopis, Vol 19, No 2, Mar 67, p 39

Abstract: During the investigation of the effect of chloroheptane on the reproduction of white rats it was noticed that cataracts not accompanied by other lesions of the eyes appeared in young rats 19 - 21 days old, and in the adult rats the cataracts were the function of the dose administered and the time of exposure. A dose of 6.9 mg/kg was used; it reduced reproduction of rats by 35% without any other clinical effects. Adaptation of animals to the influence of insecticides is discussed. No references. Submitted at the meeting of the Slovak Section of Occupational Medicine at Bratislava 21 Nov 66.

D036/D113AUTHOR: Mestman, Ya., Engineer

TITLE: An electronic engine-starting device

PERIODICAL: Gражданскaya aviatsiya, no. 9, 1961, 10

TEXT: This short article describes an electronic programming device for starting the АШ-82 Т (ASH-82T) engines, developed by V. Pinchuk, engineer in the Chief Technologist's Section of a repair establishment. The device automatically ensures that all the starting operations are carried out in the correct sequence and for the correct period of time. It is built around three electronic time relays, three РП-2 (RP-2) control relays and a power unit. The time relays each consist of a 6Н2П (6N2P) electron tube, an RC circuit and a РП-4 (RP-4) polarized relay. The feed network voltage is 24 v. The power is transmitted via the time relays to the control relay winding and from there to the respective unit of the starting system. The device uses aircraft parts and units; its programming section has no rotating parts. The main advantage of the device is that it enables the required time for each starting operation to be easily set without any dismantling and readjustment of the parts; this is done by means of potentiometers in.

An electronic engine-starting device

stalled on the front panel. The device is said to be simple in design and reliable in operation; it is now being used successfully at the engine-testing station of a repair establishment headed by Ferenets (first names not given), where it has been highly evaluated. There is 1 figure. [Attachment note: Essentially complete translation].

Golyshev, Georgiy Ivanovich, and Boris Leonidovich Meston

Osnovy vozdukhoplavaniya i aviatsii (Principles of Aeronautics and Aviation) Leningrad, Gidrometeoizdat, 1960. 290 p. 5,000 copies printed.

Resp. Ed.: Ye. V. Maksimenko; Ed.: V. S. Protopopov; Tech. Ed.: O. G. Vladimirov.

PURPOSE: This book is intended for students at hydrometeorological teknikums. It may also be used as a manual by personnel of the Hydrometeorological Service concerned with meteorological safety or other aspects of flights of airships and airplanes.

COVERAGE: This textbook outlines briefly the historical development of aviation and the theory of flight. In addition, it gives brief descriptions of the design of airships, airplanes, jet aircraft, and of the basic equipment of modern airplanes. General concepts of aerial navigation, including radio aids, flight safety, and the organization of the civil air fleet of the USSR are discussed.

1968. : Long range planning, 1968-1970 (1968)

ANAL. : 0.5 g. of sample are dissolved in water to a filter solution A. 1 ml. of the filter solution is titrated against a 0.1 N KMnO₄ solution. After the titration is completed, 10-12 ml. conc. HCl is added, the resulting solution is titrated with an excess of 0.1 N Na₂S₂O₃. The amount of Na₂S₂O₃ required to reduce the Mn⁴⁺ to Mn²⁺ is determined. A second 10-ml. sample of solution A is treated with 10-12 ml. conc. HCl and titrated with 0.1 N KMnO₄ solution (the content of Cr(6+) is determined).

ABSTRACT : 50-100 ml water, 3 ml of 1% AgNO_3 solution, and 10 gms $(\text{NH}_4)_2\text{S}_2\text{O}_8$, the resulting solution is refluxed for 30-45 min, cooled, 20 ml of conc H_2SO_4 are added, followed by an excess of 0.2 N Mohr salt solution, and the resulting solution is titrated with 0.1 N KMnO_4 (the total Cr content is determined). The $\text{Cr}(\beta^+)$ content is obtained by difference.

TITLE:

Application of the method of majoration to inelastic processes of the type $N + b \rightarrow N + b' + b''$

PERIODICAL:

Akademiya nauk Gruzinskoy SSR. Soobshcheniya, v. 29, no. 6, 1962, 665-672

TEXT: The author considers primitive Feynman diagrams for the process $N + \gamma \rightarrow N + 2\gamma$ (N denotes a nucleon). He proves that diagrams in which all photon points are situated on the nucleon polygon are majorated by a diagram in which at least one photon point is outside the polygon. The author has obtained 118 diagrams, which are stated to reduce to 26 with the aid of Symanzik's theorem and some lemmas. One of the latter is: the domain of analyticity of a certain diagram A_i is smaller or equal to the intersection of such domains of B_i and C_i for any values of external momenta. The author mentions A.A. Logunov, I.T. Todorov and N.S. Chernikov. There are 11 figures. ✓

TITLE: Application of the method of majorization of Feynman diagrams for proving
the dispersion relations
 6

SOURCE: Zhurnal eksper. i teor. fiziki, v. 44, no. 6, 1963, 1901-1906

TOPIC TAGS: dispersion relation, Feynman diagram, kaon-kaon interaction, kaon-
pion interaction

ABSTRACT: The method of majorization of Feynman diagrams is applied to an investigation of the elastic scattering of pseudoscalar Π and K mesons on K mesons. A set of all the strongly-connective diagrams of the processes of kaon-kaon and kaon-pion interaction is defined and theorems are proved that this class is majored by certain Feynman diagrams. Primitive (majorizing) diagrams are found for the elastic scattering processes and one-dimensional dispersion relations are proved with the aid of these diagrams. "The author expresses his deep gratitude to A. A. Logunov for guidance and continuous interest in the work, to I. T. Todorov for valuable remarks and an evaluation of the results, to Liu-I-ch'en and N. A. Chernikov who made it possible to become acquainted with the results of their work and to use them prior to publication."

TITLE: Analytical properties of the meson-nucleon vertex part and the scattering amplitudes of pseudoscalar mesons in perturbation theory

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 148, no. 3, 1963, 562-565

TEXT: Using the method of Feynman graph majoration and taking the pseudoscalar behavior of pions into consideration, the authors determined the analytical regions of the primitive graphs for the meson-nucleon vertex part and of the meson-meson scattering amplitude. Theorem 1: All closely connected graphs of the pion-nucleon vertex part are majorated by the graphs

 and . The rings indicate external nodes, thick lines refer to nucleons, dotted lines to pions. If $p_1^2 = p_2^2 = m^2$, the vertex function is analytical in respect of $z = p_3^2$ in the complex plane z cutting

TITLE: Quasistationary levels in a cylindrical magnetic field

SOURCE: AN GruzSSR. Soobshcheniya, v. 35, no. 2, 1964, 293-298

TOPIC TAGS: magnetic field, cylindrical magnetic field, quasistationary level, Regge pole, resonance, scattering, Landau level

ABSTRACT: The Regge-pole method, used in quantum mechanics for describing resonant states by analytical continuation of the scattering amplitude in the angular momentum complex-plane, is used to examine an idealized case of scattering by a potential having cylindrical symmetry. The scattering matrix is written out in terms of Hankel and degenerate hypergeometric functions and the bound states (Landau levels) determined for $F = 0$. The solution is then analytically continued into the complex plane and the S-matrix determined, and from this the T-matrix in terms of the scattering angle. Only the asymptotic case is considered as the Regge poles cannot be found in the general case. The meaning of the Regge poles is explained by comparison with the Breit-Wigner formula for resonant scattering so as to obtain the width of the resonance levels. "The

Title : Experimental Treatment o. Gastrointestinal Catarrh in Swine with Terramycin and Aureomycin.

Orig Pub : Magyar allatorv. lapja, 1957, 12, No 1-2, 15-17

Abstract : Experiments in the use o. antibiotics for the prophylaxis and treatment of swine in the course of fattening are described. The effectiveness of both antibiotics, especially that of terramycin, was established. Young pigs over 30 kg. should daily receive 330 mg. of terramycin and 660 m. of aureomycin each for 3 days. Treatment with antibiotics reduces the time of fattening by 2 weeks and improves the gain of animals. -- V. A. Kanzyuba.
